

sc00aa

The covariant components of the tangential magnetic field are related to the singular currents at the interfaces.

[called by: `xspecch`.]

[calls: `coords`.]

1.2 output data	1

1.1 covariant representation

1. The components of the vector potential, $\mathbf{A} = A_\theta \nabla + A_\zeta \nabla \zeta$, in the v -th volume are

$$A_\theta(s, \theta, \zeta) = \sum_{i,l} \color{red} A_{\theta,e,v,i,l} \color{black} \bar{T}_{l,i}(s) \cos \alpha_i + \sum_{i,l} \color{orange} A_{\theta,o,v,i,l} \color{black} \bar{T}'_{l,i}(s) \sin \alpha_i, \quad (1)$$

$$A_\zeta(s, \theta, \zeta) = \sum_{i,l} \color{blue} A_{\zeta,e,v,i,l} \color{black} \bar{T}_{l,i}(s) \cos \alpha_i + \sum_{i,l} \color{blue} A_{\zeta,o,v,i,l} \color{black} \bar{T}'_{l,i}(s) \sin \alpha_i, \quad (2)$$

where $\bar{T}_{l,i}(s) \equiv \bar{s}^{m_i/2} T_l(s)$, $T_l(s)$ is the Chebyshev polynomial, and $\alpha_j \equiv m_j \theta - n_j \zeta$. The regularity factor, $\bar{s}^{m_i/2}$, where $\bar{s} \equiv (1+s)/2$, is only included if there is a coordinate singularity in the domain (i.e. only in the innermost volume, $v=1$, and only in cylindrical and toroidal geometry.)

2. The magnetic field, $\sqrt{g} \mathbf{B} = \sqrt{g} B^s \mathbf{e}_s + \sqrt{g} B^\theta \mathbf{e}_\theta + \sqrt{g} B^\zeta \mathbf{e}_\zeta$, is

$$\begin{aligned} \sqrt{g} \mathbf{B} = & \mathbf{e}_s \sum_{i,l} [(-m_i \color{red} A_{\zeta,e,i,l} \color{black} - n_i \color{red} A_{\theta,e,i,l} \color{black}) \bar{T}_{l,i} \sin \alpha_i + (+m_i \color{blue} A_{\zeta,o,i,l} \color{black} + n_i \color{orange} A_{\theta,o,i,l} \color{black}) \bar{T}_{l,i} \cos \alpha_i] \\ & + \mathbf{e}_\theta \sum_{i,l} [(- \color{blue} A_{\zeta,e,i,l} \color{black}) \bar{T}'_{l,i} \cos \alpha_i + (- \color{blue} A_{\zeta,o,i,l} \color{black}) \bar{T}'_{l,i} \sin \alpha_i] \\ & + \mathbf{e}_\zeta \sum_{i,l} [(\color{red} A_{\theta,e,i,l} \color{black}) \bar{T}'_{l,i} \cos \alpha_i + (\color{orange} A_{\theta,o,i,l} \color{black}) \bar{T}'_{l,i} \sin \alpha_i] \end{aligned} \quad (3)$$

3. The covariant representation for the field is $\mathbf{B} = B_s \nabla s + B_\theta \nabla \theta + B_\zeta \nabla \zeta$, where

$$\begin{aligned} B_s &= B^s g_{ss} + B^\theta g_{s\theta} + B^\zeta g_{s\zeta} \\ B_\theta &= B^s g_{s\theta} + B^\theta g_{\theta\theta} + B^\zeta g_{\theta\zeta} \\ B_\zeta &= B^s g_{s\zeta} + B^\theta g_{\theta\zeta} + B^\zeta g_{\zeta\zeta} \end{aligned}$$

where $g_{\alpha\beta}$ are the metric elements (computed by `coords`).

4. On the interfaces, $B^s = 0$ by construction.

1.2 output data

1. The Fourier harmonics of the even-and-odd, covariant components of the magnetic field, B_s , B_θ and B_ζ , are saved in

```
Btemn(1:mn,0:1,1:Mvol),
Bzemn(1:mn,0:1,1:Mvol),
Btomn(1:mn,0:1,1:Mvol),
Bzomn(1:mn,0:1,1:Mvol);
```

and these are written to `ext.sp.h5` by `hdfint`.
